

## Installation Instructions

CERAMIC WOOD

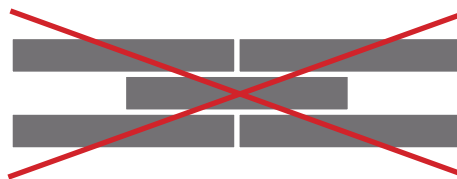

Due to their narrow width and longer length, all plank format tiles are prone to lippage. In order to guarantee a successful installation, we recommend the tiler accurately level the substrate first and use one of the latest easy levelling tools such as Tuscan Levelling System.

Ceramic Wood must be installed with a minimum grout joint of 1.5mm.

To reduce the visibility of lipping, Ceramic Wood should be installed in either a stack pattern, or an offset pattern, with staggering at 3/4 intervals or less. Examples are shown below.

Ceramic Wood should NOT be installed in this brick pattern.
